8             {
9                 System.out.print(" ");
10            }
11            System.out.println();
12        }
13    }
14 }
15
```

→ Initialization → *Setting value* → *setting value to 0*
 → Condition → *verification for the loop condition*
 → Statement → *Print the value based on condition*
 → Update :
 Increment → $post (var++) \rightarrow pre (var++)$
 → Relational op in condition ($<, <=$)
 Decrement → $post (var--) \rightarrow pre (var--)$
 → Relational op in condition ($>, >=$)

Looping

- * do while
- * while loop
- * for loop
- * foreach
- * Nested loop

do while

→ do while
 do {
 Statement
 } while (Condition)

while

while (Condition)
 {
 Statement
 }

for loop

for (Initialization; Condition; Update)
 {
 Statement
 }

Nested loop

for (Initialization; Condition; Update)
 {
 for (Initialization; Condition; Update)
 {
 Statement
 }
 }

Looping Statements:
 Loops make perform the same task with different results.
 Ex: Actually here we repeat the number of times we execute the for statement.
 To perform looping, we need to follow these steps:
 1. Init → $int i = 1$
 2. Cond → $i < 10$
 3. Body → $i++$
 4. Ret → return looping value
 5. End → return looping value
 Initialization: here, we specify the begin value, by which condition we give a condition to provide so we loop in a process, if it is false we stop the process.
 Statements: here, specify the execution in statement.

→ Initialization → *starting value* → *ending value is fixed*
 → Condition → *Verification for exit the loop or body*
 → Statement → *Print the data based on the condition*
 → Update
 Increment → $\text{for}(var++)$ → $\text{for}(var++)$
 → Relational op in condition ($<$, $<=$)
 Decrement → $\text{for}(var--)$ → $\text{for}(var--)$
 → Relational op in condition ($>$, $>=$)

→ looping

2) while loop:
 In while loop,
 condition is checked
 Note:
 what we are in
 3) For loop:
 It is a entry
 Irrespective
 follow its e

1) do while:

-->The Do while Loop is an Exit controlled loop in which the condition is verified after the statement are executed.

Note:

Without the Verification the Statement will Execute first then , later the Condition will get checked.
Do while loop will execute atleast once even though the condition is false.

2) While loop:

In While loop, we write the Keyword while and we pass the condition , if the condition is true then we process for execution and when the condition is false we have to Stop the Process.

Note:

What we are initializing our variables with and where we are writing and update

Note:

What we are initializing our variables with and where we are writing and update

3) For loop:

It is a entry check loop which is efficient and organized.

Irrespective of the program written or the logic we have developed, for loop continue to follow its execution flow.

Looping Statements:

Iterate means perform the same task with different inputs.
So, Basically here we repeat the number of times we execute the java statement based on few Scenarios.

To perform looping, we need to follow these Steps

Ex: (Print--> 0>10)-->Task
0-->means Beginning Value
10-->means Ending value

Initialization-->Here, we specify the begin index, by initializing variables.

Condition-->We give a condition to provide an end limit if the condition is true then we proceed, if it is false, we stop the process.

Statements-->Here, Specify the execution in Statement.
